

Instalar CyberClient

Content

- [Install CyberClient \(Client Module\)](#)

Installing **CyberClient** in the **Windows** environment is very simple. By following the steps below you can perform the process without any inconvenience.

[Watch: Install and configure CyberClient](#)

Install CyberClient (Client Module)

1) Download the **CyberClient** installer.

- If you use the [Lite Version](#) you can download it from: <https://tenaxsoft.com/descargas>
- If you use the Premium version you must download it from the [Customer Panel](#) on our website.

2) Start the installation on each of your Client PCs and follow the steps of the wizard.

3) Configure **CyberClient** on each of your Clients PCs. [Configuration of CyberClient](#).

4) From the **CyberClient** settings enter the [Prints tab](#) and click **Install**.

This utility installs the shared and controlled printers in **CyberPlanet** (PC Server).

Importante

If you have network printers (local printers with network port) you must install them manually on each of your Client PCs.

For **Print Control** to identify network printers, they must have the same name on PC Server and Client.

We advise to simplify the names. For example: Instead of "HP Laserjet 1020", place it as "LaserBN". [More information](#).

Suggestion

It is recommended to remove printers that you do not use to optimize your network resources.

If you have any concerns do not hesitate to contact our [Technical Support](#).

Download the CyberClient installer.
